Hell on Wheels: Port Authority's Broken Promise Is Choking Newark's Kids

BY MAX RIVLIN-NADLER

May 3, 2016

Seaport and UNGD Communities?

What's the Connection?

- Similarities in chemical hazards and exposures
- Disproportionate distribution of risks and benefits
- Environmental justice (EJ) usually focused on urban areas, poor communities, and people of color...
- But similar principles apply to unconventional natural gas development (UNGD)

Health Effects of Air Pollution on Local Communities

No UNGD sites in New Jersey

...but we do have air pollution

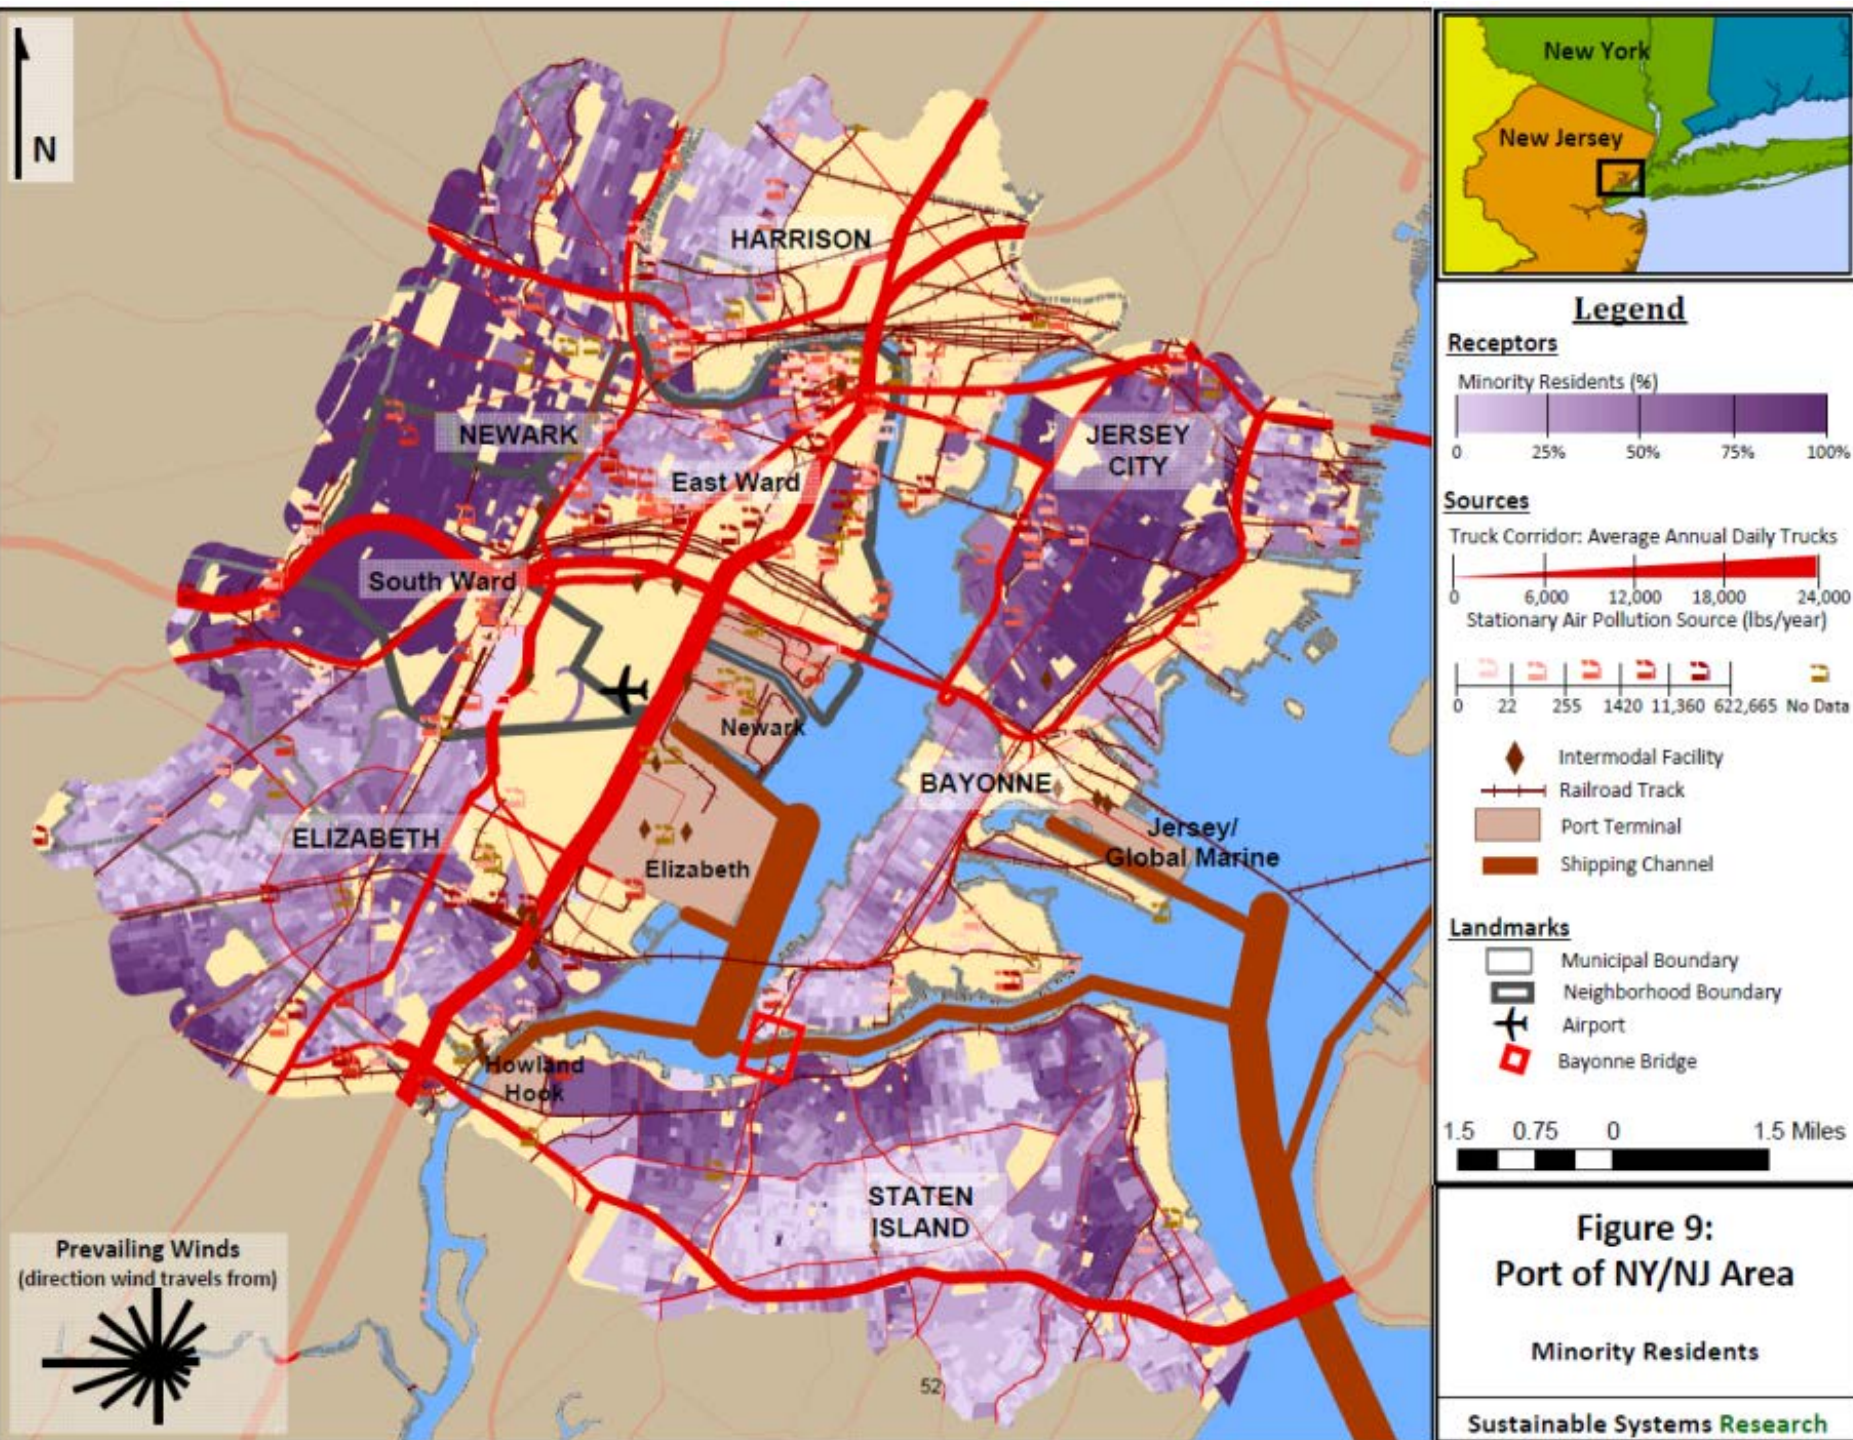

Most air emissions from fracking are not new

...but 'hyperlocal' impacts are a big knowledge gap

Ports-impacted Environmental Justice (EJ) communities : Newark/Elizabeth Seaport and Airport

Location of Ambient Air Monitors around Ironbound, Newark, NJ

Liberty Airport

Diesel Trucks in Newark

Community members counted 144 diesel trucks passing by Hawkins Street K-8 School in the Ironbound from 7:30 to 8:30 AM on Dec 11, 2009.

UNGD: Potential Environmental Hazards

- Water pollutants
- **Air pollutants**
- Noise
- Other stressors
 - Light
 - Anxiety
 - Psychological stress

NRDC (2014)

Fracking Fumes: Air Pollution from Hydraulic Fracturing Threatens Public Health and Communities

HEALTH THREATS FROM FRACKING-RELATED AIR POLLUTION

GLOBAL EFFECTS

Emissions of carbon dioxide and methane contribute to climate change. Methane warms the climate at least 80 times more than an equal amount of carbon dioxide over a 20-year period.

REGIONAL EFFECTS

Nitrogen oxides and volatile organic compounds form ground-level ozone in the presence of sunlight, which can cause:

Respiratory problems, including coughs, shortness of breath, airway and lung inflammation, decreased lung function, worsening of asthma and other respiratory diseases, increased hospital admissions, and premature mortality

Cardiovascular effects, including cardiac arrhythmia, increased risk of heart disease, heart attacks, and stroke

LOCAL EFFECTS

Exposure to diesel particulate matter, hydrogen sulfide, toxics, including benzene, toluene, ethylbenzene, and xylene, and other volatile hydrocarbons can lead to:

Eye, nose, and throat irritation

Respiratory problems, including cough, difficulty breathing, and worsening of asthma and other respiratory diseases

Cardiovascular problems, including high blood pressure, heart attacks, and worsening of cardiac diseases

Brain and nervous system problems, including headaches, lightheadedness, and disorientation

Damage to the blood and bone marrow leading to anemia and immunological problems

Reproductive system effects

Effects on fetal and child development

Cancer and premature mortality

Community-Centered Concerns

- **UNGD communities**
 - Disease
 - Illness
 - Symptoms
 - Exposures
 - Uncertainty
 - Distrust
 - Global Energy Industry
- **“Traditional” urban EJ communities**
 - Disease
 - Illness
 - Symptoms
 - Exposures
 - Uncertainty
 - Distrust
 - Global Goods Movement Industry

Current Challenges

- Characterizing exposure: What? How much? Where? When? How long?
- Multiple exposures and stressors
- How do we take a more holistic approach?
 - Empirical evidence of symptoms, illness, disease
 - Learning more about ‘hyperlocal’ impacts
 - In what ways can we generalize about local conditions?

Air Pollutants from UNGD

1. Non-methane hydrocarbons and other constituents of raw natural gas
2. Fracking fluid compounds
 - Many and ??
3. Combustion products
 - Particles
 - Gases and vapors
4. Road “dust”
5. Secondary air pollutants
 - Ozone

Air Pollutants from UNGD

- Natural gas constituents
 - Average raw nature gas composition:
 - 78% methane, 18% Non-Methane Hydrocarbons (NMHCs), less than 2% nitrogen, carbon dioxide, hydrogen sulfide, and water
 - NMHCs
 - Ethane, propane
 - Benzene, ethyl benzene, toluene, xylene (BTEX), etc.
- Released during drilling, from “produced water,” condensation tanks

Air Pollutants from UNGD

- Fracking fluid compounds
 - Silica
 - Proprietary formulations
 - Solvents
 - Acids
 - Surfactants
 - Lubricants
 - Biocides, etc.

Air Pollutants from UNGD

- Combustion products
 - Diesel exhaust (drill rigs, trucks, compressors)
 - Particles – “diesel particulate matter” (DPM)
 - Vapors and gases
 - VOCs (Benzene, formaldehyde, etc)
 - Polycyclic aromatic hydrocarbons (PAHs)

Air Pollutants from UNGD

- “Dust” – onsite and roadway
 - “Crustal material”
 - Re-suspended contaminants

Air Pollutants from UNGD

- Secondary air pollutants - Ozone

What can these pollutants do to health?

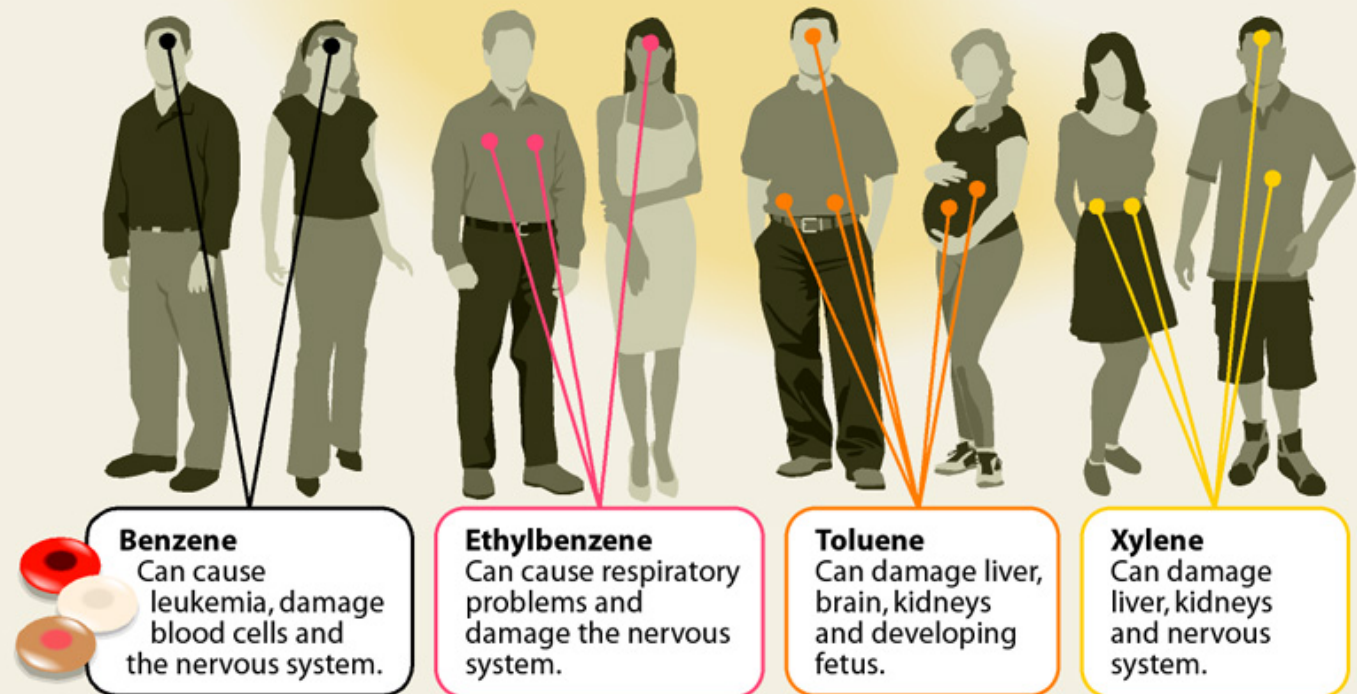

Example Open-Air Waste Pit Emissions:

Waste Pit Emissions — The Big Unknown

The open-air waste pits used in oil and gas production contain chemicals known to affect human health. But because air emissions from pits are rarely monitored, it's impossible to know if they release chemicals in quantities large enough to cause problems for nearby residents. The four chemicals shown below are some of the most studied compounds. Not shown are dozens of others, including cyclohexane and trimethylbenzene, that can also be dangerous.

inside
climate
news

POTENTIAL HEALTH IMPACTS OF FOUR AIRBORNE CHEMICALS

All four chemicals irritate the eyes, nose, throat and skin to varying degrees. Headaches, dizziness, lightheadedness, nausea and vomiting are also universal reactions to these chemicals.

SOURCES: National Institute for Occupational Safety and Health (NIOSH); Agency for Toxic Substances and Disease Registry (ATSDR); California's Office of Environmental Health Hazard Assessment (OEHHA); health experts Celeste Monforton and Wilma Subra

What is the Goal?

“Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.

World Health Organization

Health Outcomes that Matter

- **Five D's**
 - Death
 - Disease
 - Disability
 - Discomfort
 - Dissatisfaction

Health Outcomes are Rarely Ever Certain

- **Risk = Hazard x Exposure**
- Hazard: Intrinsic toxicity of the agent
- Exposure: Determines the dose
- “The dose makes the poison” –Paracelsus

Risk in the “Real-World”

- But risk occurs in a context
 - Places/locations
 - Time
 - People
 - Susceptibility
 - Individual values
- How complicated is that!?

Risk = Hazard x Exposure:

Assessing Hazard

- Animal models
- Controlled exposure (chamber) studies with human volunteers
- Studies of workers: compare the experience of exposed workers to unexposed workers

Risk = Hazard x Exposure:

Assessing Hazard

- Population studies
 - Cohort studies: Compare people living in cities with different air pollution levels
 - Time-series studies: Examine deaths and hospitalizations from day-to-day in the same population
 - Panel studies: Follow smaller groups of people over time with monitoring of exposure

Standards: National Ambient Air Quality Standards (NAAQS)

State and Local Monitoring (SLAMS) Network

Pennsylvania Air Monitoring Network

NAAQS Relevant to UNGD

- Particulate Matter ($PM_{2.5}$ and PM_{10})
 - Includes diesel particulate matter, other combustion products, road dust
- Inorganic gases
 - Nitrogen oxides (NO_x)
 - Carbon monoxide (CO)
- Secondary pollutants
 - Ozone (O_3), formed from NO_x and VOCs

EPA Hazardous Air Pollutants (HAPS)

- a.k.a Air Toxics
- HAPs have no concentration standards
 - Reference concentrations: noncancer and cancer
- Performance standards for controls on emissions

HAPs and other VOCs Relevant to UNGD

- VOCs
 - Non-methane hydrocarbons, eg. BTEX
 - Fracking fluid components
 - Vehicle and equipment emissions
- Some can cause cancer, birth defects, nervous system effects, etc.
- Some implicated in asthma, developmental disorders

Diesel Exhaust: A Mixture of Particles, HAPs, and other VOCs

- Particles less than 2.5 microns (PM 2.5)
- Mostly less than 0.1 micron (“ultrafine”)
- 40 known toxic chemicals
- Black carbon measured as a “marker”
- Air levels not regulated, per se.

Particulate Matter Air Pollution

- Health effects
 - Respiratory disease and death
 - Cardiovascular disease and death
 - Developmental?
 - Neurodegenerative?

Diesel Exhaust and Cancer Risk

- Miner studies: Increased lung cancer
- IARC 2012– Diesel exhaust causes lung cancer
- Exposure assessment
 - Relatively high levels in confined spaces
 - Long periods of exposure
- Is intermittent exposure a cause of cancer?

Risk = Hazard x Exposure:

Assessing Exposure

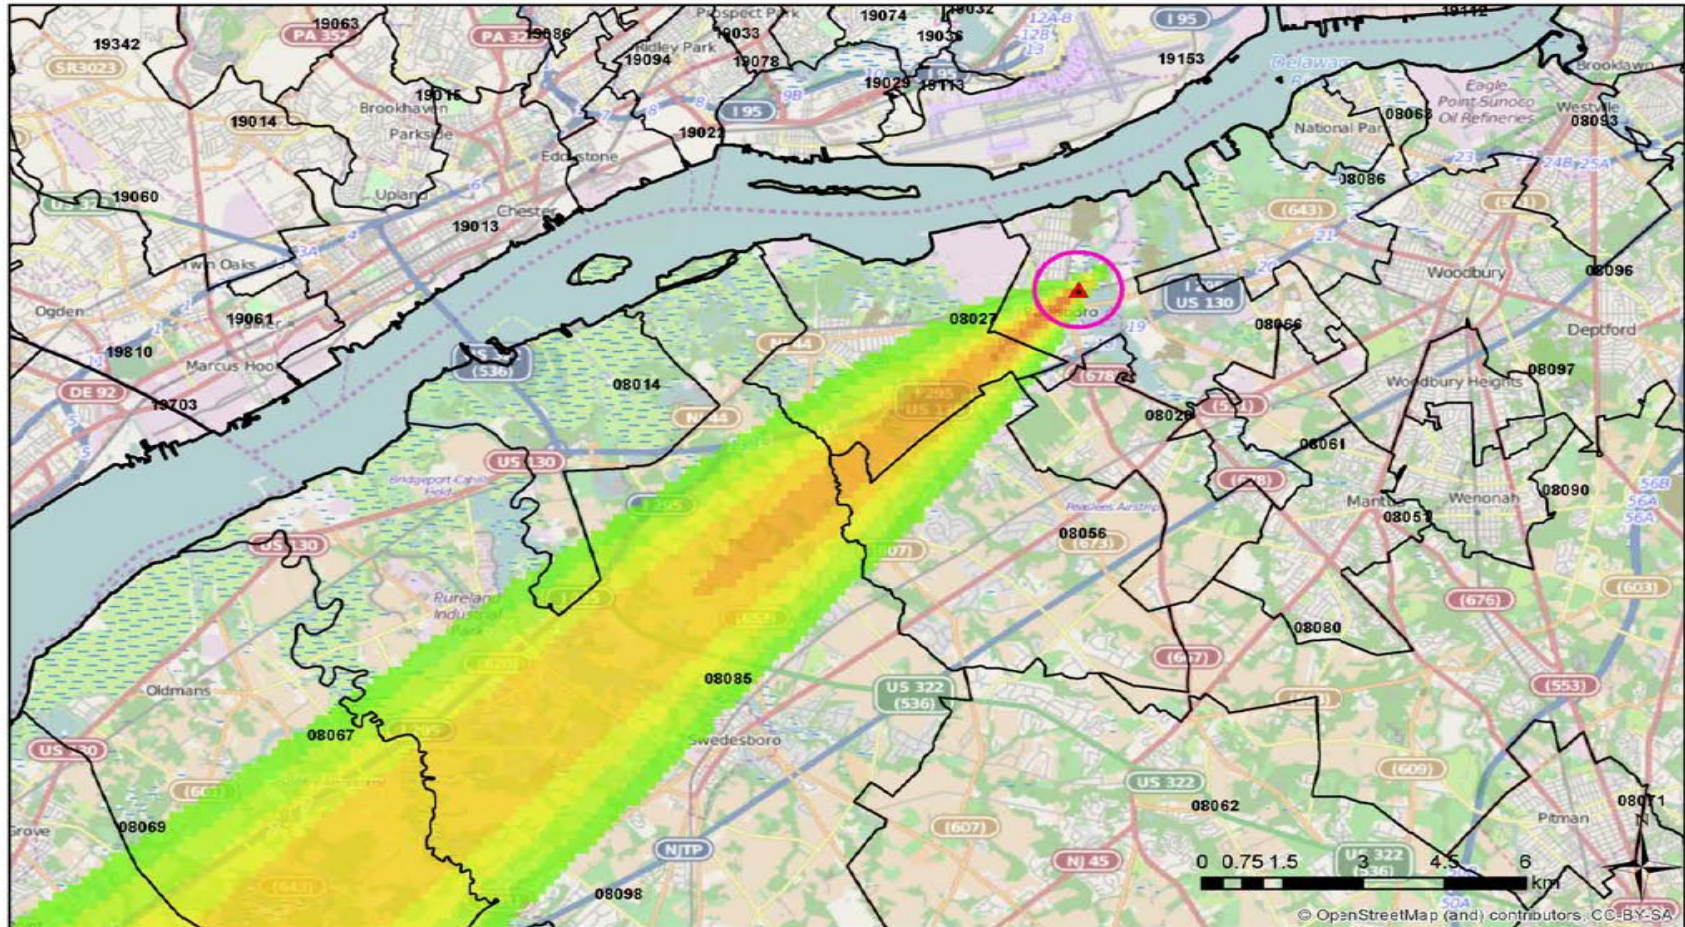

- Exposure pathways
 - Source, transport, route of exposure, exposure
- Transport: Air that moves
- Route of exposure: Primarily inhalation
- Dispersion
 - “Source strength”
 - Wind direction and speed
 - Topography
 - Vertical mixing

Dispersion of air pollutants

For illustration purposes: Modeling the plume of a vinyl chloride spill in New Jersey

Concentration of VC 10 hr after release (AD sim, REL inst:cont 90:10, ICD 20mx20mx10m)

VC concentration ($\mu\text{g}/\text{m}^3$)

Local effects of air pollution: Diesel exhaust cancer risk in NJ

- Risk of lung cancer may be as high as about 1 in 1,000 from lifetime exposure to diesel particulate matter in some urban communities in NJ

Benchmark = 1 in 1 million risk level

Health Effects of Short-Term Exposures to Diesel Exhaust

Some of our research approaches:

1. Controlled environment facility
2. On highways during commuting
3. In affected communities

A Controlled Exposure Study

- Isolate the effect of the air pollutant
- 15 adults with asthma
- Exposure to diluted diesel exhaust (300 $\mu\text{g}/\text{m}^3$) for 1 hour
- Compared to clean air
- Lung function, airway hyperreactivity, measures of oxidative stress

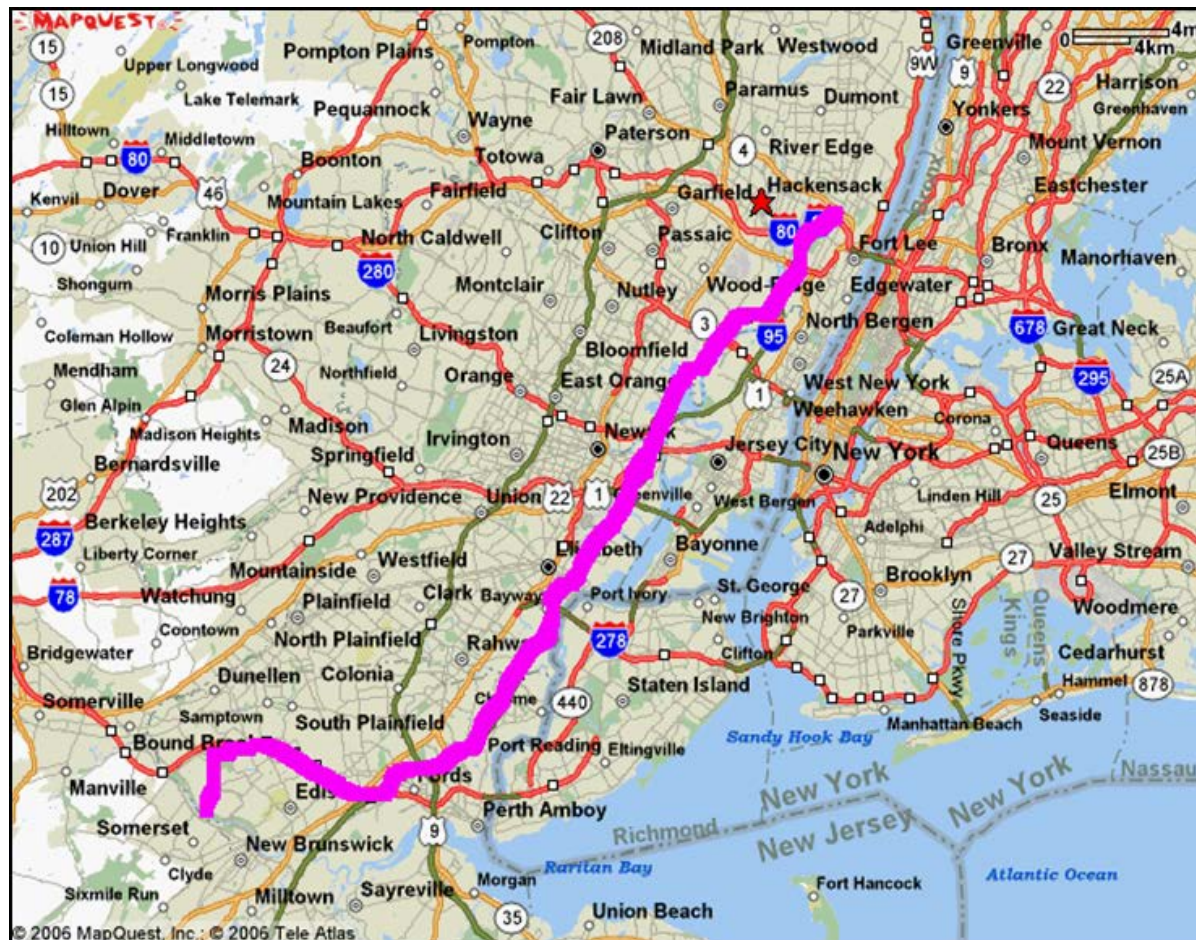

FEV1 before and after diesel vs clean air exposure among adults with asthma (FEV1 as % predicted)

Commuter Exposure to Diesel Exhaust

90-minute rides from campus to Exit 18 and back, mostly on NJ Turnpike in the truck lanes

One recent study: 21 healthy adult volunteers on 2 rides at least 1 week apart:

- One ride breathing clean air with particles filtered out
- One ride breathing regular “highway air”

Nitrite levels in exhaled breath condensate before and after traffic particle (solid line) vs. filtered air exposure (dotted line)

Community Study: Impacts of Exposure to Diesel Exhaust on Asthma

- “Effects of Traffic Air Pollution and Stress on Childhood Asthma in an Urban Community,” funded by US EPA
- A community-based participatory research project with the Ironbound Community Corporation
- 40 children aged 9-14
- Wearing personal monitors for black carbon and NO₂
- Stress levels measured by interviews and stress hormone levels
- Does stress makes kids more susceptible to the effects of air pollution on asthma?

Monitoring personal exposure to traffic-related air pollution in Newark NJ

Personal black carbon monitor:
24-hr continuous 1-min. ave. with GPS
location

Ogawa Passive Sampler
for NO_2 , daily 24-hr average

Black carbon levels during one day for one participant

Personal BC data Elizabeth-Newark

Controlling Hazards

- Engineering controls
 - Product substitution
 - Closed systems
 - Filtration/capture of emissions
 - Dust suppression
- Set-back distance: How far?

Location of Ambient Air Monitors around Ironbound, Newark, NJ

Liberty Airport

Is Citizen Science Part of the Answer?

- New, low-cost monitors
 - Particulate matter
 - Nitrogen dioxide
 - Ozone
- Can be deployed widely
- Measure in several locations simultaneously
- Measure personal exposures
- Multiple monitors
- GPS and mapping

Conclusions

- We know a lot about the *potential* health effects of “fracking fumes.”
- Risk = Hazard X Exposure
- We need to know more about hazard
 - What’s in fracking fluids?
 - Who is susceptible to air pollutants, and when?
- We need to know more about exposure
 - Variability in time and space
 - The important factors in exposure pathways
 - Co-exposures to other chemicals and stressors
- Precautionary approach and more studies needed

Questions?
